## To Create a Custom Border

By default Quik Series border setup routines use a border called 'Qborder'. However customers have the facility to create a customized border to reflect their companies image.

There is a blank border located in the 'C:\Qframe\Blocks' folder called 'blank border.dwg'. To create a custom border, then open this drawing in IntelliCAD and use the 'Save As' command to rename the drawing to the desired name.

In the blank border, a space has been left where you may insert your company logo or any required text. You may alter or rearrange any text within the blank border as you see fit. Lines may be copied, moved or erased as required.

But please do not delete any of the attributes. These attributes are vital to the borders operation. Existing attributes may be moved or rearranged as required. If desired attributes visibility may be changed from visible to invisible.

When inserting company logo's make sure they are in dwg format. Inserting bitmaps seldom works and is generally a waste of time. Also watch the size of the logo used. There is no point creating a custom border if the border winds up several megabyte in size. Whilst the border may look pretty the speed penalty taken will certainly overrule the border size.

Good luck.
